-: DISEASE: Defects in AIRE are a cause of autoimmune poly-
endocrinopathy candidiasis ectodermal dystrophy (APECED), also
called autoimmune polyglandular syndrome type I (APS-I), an
autosomal recessive disease characterized by: (1) autoimmune
polyendocrinopathies: hypoparathyroidism, adrenocortical failure,
polyendocrinopathies: hypoparathyroidism, pernicious anemia, and
hepatitis; (2) chronic mucocutaneous candidiasis; (3) ectodermal
dystrophies: vitiligo, alopecia, keratopathy, dystrophy of dental
enamel, nails and tympanic membranes. In addition, a high
proportion of patients develop squamous cell carcinoma of the oral
mucosa. The disease is reported worldwide but is exceptionally
the Iranian jews (incidence 1:9000).
-: SIMILARITY: CONTAINS 1 HSR DOMAIN.

                                                                                                           TISSUE SPECIFICITY: Expression may be restricted to a small number of scattered cells in most tissues. Highly expressed in a few cells in the medulla of the thymus. Detected at very low levels in thymus, lymph node, liver, brain, ovary, lung, testis, kidney, heart, spleen, bone marrow, skeletal muscle and adrenal gland. Isoforms 3a to 1d predominate, isoforms 2a to 2d are intermediate and isoforms 3a to 3d are expressed at extremely low levels.

DOMAIN: The L-x-x-L-L repeats may be implicated in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA as dimer and tetramer, but not as a monomer. Binds to G-doublets in an A/T-rich environment; the preferred motiv is a tandem repeat of ATTGGTTA combined with a TTATTA-box. May be involved in immune regulation (By similarity).

SUBCULULAR LOCATION: Predominantly nuclear but also cytoplasmic. SUBCLULUAR LOCATION: Predominantly nuclear but also cytoplasmic. Found in nuclear body-like structures and in a filamentous vimentin-like pattern.

ALTERNATIVE PRODUCTS: At least 12 isoforms; la (shown here), 1b, 1c, 1d, 2a, 2b, 2c, 2d, 3a, 3b, 3c and 3d; are produced by alternative colinion to the structure of the struc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Autoimmun. 13:307-313(1999).
nuclear receptors.

DOMAIN: The N-terminal HSR domain is required on tubular structures (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1c, 1d, 2a, 2b, 2c, 2d, 3a, 3b, 3d alternative splicing.
